Art Unit: 2664

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 2/24/04 has been entered.

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-49 are rejected under 35 U.S.C. 103(a) as being unpatentable over Goldman et al (of the record, US Pat. # 6,134,235) in view of Nimmagadda (newly cited, US Pat. # 6,426,961).

Regarding claims 1-49, Goldman et al disclose a system and method for bridging the POTS network and a packet network comprising a switch for analog signals, the switch being connected to a first network (lines 32-35, col.9; 110 of fig. 2A); a router for routing Internet Protocol packets, the router being connected to a second network using Internet Protocol addressing (223 of fig. 2A); a telephony gateway for converting analog signals into Internet Protocol packets into analog signals, the telephony gateway being connected to both the switch and the router (140 of fig. 1); a signaling gateway

Art Unit: 2664

connected to the router, the signaling gateway using an in-band signaling protocol for signaling the telephony gateway through the router (lines 36-42, col. 9); the signaling gateway is also connected to an out-of-band signaling network, the signaling gateway having a translating in-band signaling to out-of-band signaling and for translating out-of-band signaling to in-band signaling (lines 60-66, col. 9); a remote access server for converting analog data signals into Internet Protocol packets and for converting Internet protocol packets into analog data signals, the remote access server being connected to both the switch and the router (lines 5-25, col. 10); the switch is controlled by an Incumbent Local Exchange Carrier, and the telephone gateway and the router are controlled by a Competitive Local Exchange Carrier (lines 26-42, col. 1). The switch of Goldman et al fails to differentiate between voice signals and data signals and route voice signals to the telephony gateway. Nimmagadda discloses a communication system which comprising the switch (20 of fig. 5) which differentiates between voice signals and data signals and route voice signals to the telephony gateway (16,108 of fig. 5). Therefore, it would have been obvious to one skilled in the art to use switch which differentiates between voice signals and data signals and route voice signals to the telephony gateway as taught by Nimmagadda in the system of Goldman et al in order to route voice or data so that the voice will be properly routed to PSTN network and data will be routed to data network (i.e. Internet network).

4. Applicant's arguments with respect to claims 1-49 have been considered but are moot in view of the new ground(s) of rejection.
